INTRODUCTION

This publication announces the decision of the State Director on the initial phase of the wilderness inventory of Nevada lands administered by the Bureau of Land Management.

On May 1, 1979, a 90-day public comment period was initiated on the Bureau's recommendations for the initial phase of the wilderness inventory. A document titled Draft Initial Inventory was issued at that time along with a series of maps which identified the Bureau's recommendations on the initial wilderness inventory on all of the lands administered by the BLM in Nevada. The comments received have been carefully analyzed and considered by the BLM's six District Managers and the State Director. A number of changes to our original recommendations have been made as a direct result of those comments. Our decisions contained in this document identify those lands that obviously lack wilderness values and are eliminated from the wilderness inventory process.

The intent of the initial phase of the wilderness inventory is to eliminate from further wilderness consideration those lands that beyond doubt clearly lack wilderness characteristics. These are lands that nearly everyone can agree do not have wilderness values. Very little field work and written documentation were required to verify that these lands are definitely lacking wilderness qualities. For the most part, lands in this category are being eliminated on the basis of existing information rather than a detailed field analysis.

Those areas that may have wilderness values are being reserved for the intensive phase of the wilderness inventory. Lands in the intensive inventory category will receive a thorough field review to determine whether or not the essential criteria of size, naturalness, and outstanding opportunities for either solitude or primitive and unconfined recreation are met. Those roadless areas that meet these criteria will be identified as Wilderness Study Areas, and those that do not will be eliminated from the wilderness review process. A 90-day comment period on our proposed decision for the intensive wilderness inventory will take place late next spring.

This document includes a summary of public comments received for each area in the State, and explains whether or not the comments changed our original recommendation. The amount of acreage being eliminated from the inventory process and the acreage that will be intensively inventoried is listed for each area. An updated series of ½-inch per mile maps reflecting this decision are available. A key to these maps is located in the lower left hand corner of the revised Statewide map that accompanies this document. The updated maps will show those areas, or portions of areas, that clearly lack wilderness character and are being eliminated from the review process. Areas that have undergone a change in inventory status from our original recommendation have been underlined on the map. The narratives in this document will explain why the changes were made.

In some cases, errors in unit numbering, recommended inventory status, or boundaries occurred on our original maps or our draft summary book. These have been corrected on the revised maps and narratives. If the acreage listed for an area has changed from the original acreage listed in the Draft Initial Inventory document, that change is a result of a more precise calculation.

The summary of public comment in the narratives is necessarily brief. A summary of the public comment received is available and should be included with this book. Anyone wishing to review the actual comments received and the criteria used in coding the comments is welcome to visit the BLM's Nevada State Office in Reno.

The summary of public comments in this book may include a reference to "other resource values". This means that some of the comments received addressed the values of other resources such as minerals or grazing rather than the presence or absence of wilderness criteria. Although these other resource values were not used in reaching our decision on the inventory phase, each comment will be retained and carefully considered in the study phase when the Bureau will weigh wilderness values against other resource values in the same area during the BLM land use planning efforts.

In some cases, comments were received which were not field checked. These comments will be reviewed in the intensive phase of the wilderness inventory, if the area has not been eliminated in the initial phase.

During the past year, we have recognized the need to accelerate the intensive inventory process on a number of areas that have had major developments proposed. Most of these proposals were generated by mining or oil and gas exploration and production activities, or by powerline construction projects. On these areas, the question of whether or not wilderness values exist had to be resolved in advance of the normal State inventory schedule. Areas in this category are identified in this document.

Eleven natural areas exist in Nevada. These lands were identified by Congress as areas that require a rapid analysis with a report on each area submitted by June 1980. As special update on the status of the inventory on these areas will be issued in the near future. Two of the areas, Mountain Meadow (NV-060-221) and Sunrise Mountain (NV-050-0420) are identified in this document as areas that clearly lack wilderness characteristics.

Unless protests are received, the decisions in this document will be implemented on October 30, 1979.
